

BRIEFING NOTE

To: VP Engineering, Monitri BaaS

From: Anumeha Princy, PMP® — Operations PM, Monitri BaaS

Date: May 31, 2025

Subject: Stripe Gateway — Dual Systemic Risk | Permanent Fix Required

Classification: Internal — Engineering Leadership

Related: F20MFD-1 (DEP-0109) · F20MFD-2 (DEP-0104) · FIDP-2025-001 Analytics Q8, Q14

Purpose

This briefing note formally documents Stripe as a dual systemic risk to Monitri's platform operations and requests VP Engineering action to implement a permanent fix. This is not an incident report — it is a pattern escalation requiring structural resolution.

The Dual Risk — What FIDP Data Shows

Risk 1 — Vendor SLA Breach	Risk 2 — CI/CD Root Cause
Stripe breached its contracted SLA in 3 consecutive months (March, April, May 2025). Vendor performance score: 8/10 — declining. Escalation in progress per Vendor Scorecard.	API version mismatch with Stripe gateway is the #1 recurring CI/CD failure root cause — appearing 4 times across Jan–May 2025. No other root cause exceeds 2 occurrences.
■ Proof: SQL Query Q8 — vendor_performance table, VND-001	■ Proof: SQL Query Q14 — cicd_pipeline table, Root_Cause frequency

The combination of vendor SLA breach AND recurring CI/CD root cause elevates Stripe beyond a standard vendor concern. Stripe is simultaneously underperforming as a vendor and destabilizing our deployment pipeline. These two failure tracks require coordinated resolution — not separate incident patches.

Data Summary

Metric	Detail	Source
Vendor SLA breaches	3 consecutive months — Mar, Apr, May 2025	Q8 — vendor_performance
CI/CD root cause frequency	4 occurrences — highest across all root causes	Q14 — cicd_pipeline
Client impact from Stripe-linked failures	DEP-0212: 34 clients DEP-0109: 58 clients (network timeout/Stripe API)	Q6, Q9 — cicd_pipeline
Stripe vendor performance score	8/10 — declining trend	Q8 — vendor_performance

Actions Requested from VP Engineering

- Implement a permanent Stripe API versioning protocol** — establish a version-lock agreement between Monitri Engineering and Stripe. Each Stripe API version upgrade must be validated in staging before production deployment. This is a structural fix, not another patch.

■ Backed by: Analytics PM Actions Q14 Step 2 | cicc_pipeline Root_Cause frequency data

2. Prioritize the Stripe integration fix above other engineering backlog items — 4 occurrences across 5 months with direct client impact (34–58 clients per incident) justifies immediate reprioritization. Each recurrence carries the same client impact risk as DEP-0109.

■ Backed by: Analytics PM Actions Q14 Step 3 | Q6 client impact data — cicc_pipeline table

3. Establish a recurring root cause escalation threshold — any root cause appearing 3 or more times across CI/CD failures triggers automatic escalation to Ops PM and VP Engineering for structural review. Stripe has already exceeded this threshold.

■ Backed by: Analytics PM Actions Q14 Step 5 | Q14 root cause frequency analysis

Timeline

- API versioning protocol design — VP Engineering to provide approach by June 7, 2025
- Staging validation process documented — by June 14, 2025
- Recurring root cause threshold formalized and distributed — by June 10, 2025
- Permanent fix deployed — target June 30, 2025
